

## Assignment 6: Main Menu

(5 marks)

### Background:

Currently, when you go to <http://mrkam.ca/web12/yourname>, you will automatically be redirected to <http://mrkam.ca/web12/yourname/html01> because of the code in `/yourname/index.html`.

The current code in `index.html` reads:

```
<!DOCTYPE html>
<html>
<head>
<meta http-equiv="refresh" content="0; url=./html01">
<title>Redirecting...</title>
</head>
<body>
Click <a href="./html01">here</a> to be redirected.
</body>
</html>
```

### Overview:

For this assignment, you will be modifying `index.html` such that it no longer redirects but rather allows the user to select which website he/she wishes to visit through a simple iframe menu.

### Tasks:

1. Backup `/yourname/index.html` by renaming it to `index.bak`.
2. Create a new `index.html`. Copy and paste the following HTML code:

```
<!DOCTYPE html>
<html>
<head>
<title>Portfolio, version 1.0, by [Full Name]</title>
</head>
<body>

<a href="html01" target="this">HTML Assignment 1</a>&nbsp; &nbsp; &nbsp; &nbsp;
<a href="html02" target="this">HTML Assignment 2</a>&nbsp; &nbsp; &nbsp; &nbsp;

<iframe src="html01" width="100%" height="85" name="this"></iframe>
</body>
</html>
```

3. Edit `index.html` to have the following behavior:

HTML Assignment 1: redirects to `/yourname/html01`  
HTML Assignment 2: redirects to `/yourname/html02`  
HTML Assignment 3: redirects to `/yourname/html03`  
HTML Assignment 4: redirects to `/yourname/html04`  
HTML Assignment 5: redirects to `/yourname/html05`  
HTML Project: redirects to `/yourname/htmlsite`
